PROTECT YOURSELF AND YOUR CUSTOMERS FROM COVID-19

Wear a Mask and Know Your Rights

If you work indoors or in vehicles with others, your employer must give you well-fitting medical masks and respirators, if you ask. You can choose to wear them or not. If you request N95 (NIOSH-certified) respirators, your employer must provide ones that are the right size as well as basic instructions on how to use them. This applies whether you are fully vaccinated or not. If your employer requires universal masking indoors, they must provide well-fitting medical masks.

✓ Your employer must give you the masks or respirators for free.
✓ Your employer cannot discourage or retaliate against you for wearing a face mask.

Ask for your mask!

Know which Masks Provide the Best Protection Against COVID-19

Respirators:

- N95 and KN95 respirators are designed to filter at least 95% of airborne particles (KF94s filter 94%). But they may be less comfortable because they filter better and fit more tightly.
- They may not fit as well if you have facial hair.
- To work well, respirators need to make a tight seal on your face. See NIOSH instructions for how to put on, take off, and check the seal of a respirator.
- Check the seal each time you put one on.
- If you have breathing difficulties, check with your doctor before wearing a respirator.
- Do not wear a respirator with another mask.
- If choosing a KN95 respirator, use one that has been tested by NPPTL or offers filtration efficiency of 95% or higher.
- Beware of counterfeit (fake) respirators as they may not be able to provide the promised protection.

Medical/Surgical Masks:

- Masks with an adjustable nose bridge that are made of at least three layers of non-woven material (melt-blown fabric and/or polypropylene) will provide increased protection and meet the requirements for a “medical mask.” These masks are often sold as disposable, protective, medical, or surgical masks.
- Medical masks should be resistant to fluids. Test your mask with a drop of water on the front. The water should not soak into the mask. It should form beads of water on the surface.
- These masks are loose fitting and need be adjusted to secure a tight fit.
- The fit can be improved by knotting the ear loops close to the edge of the mask and tucking the excess material. You can also use a mask brace to reduce air leakage from the edges of the mask.
- Double masking is strongly recommended. This is wearing a medical mask UNDER a tight-fitting cloth mask to greatly increase filtration and reduce leakage. Double masking provides much more protection than a medical mask alone.

Your respirator must be replaced if it gets damaged, deformed, dirty, or difficult to breathe through.

In general, you should change your respirator at the beginning of every shift. The CDC recommends that your respirator be replaced after it has been put on and taken off five times.
